

BARGO

Retail supply chains are broken at the infrastructure level

Systems (ERP,
WMS, POS)
don't talk to
each other

Retailers lack
real-time
visibility
across inventory
and demand

Forecasting is
reactive,
inaccurate,
and manual

Decisions are
fragmented
across teams and
tools

We provide a unified intelligence layer that

Connects all
retail data
systems

Continuously
forecasts
demand and
supply risk

Automates
replenishment
and inventory
decisions

Orchestrates AI
agents across
supply chain
workflows

Early signals

- We are starting with the most urgent retail pain point: smarter inventory and automated decisions.
- We have designed an early system that can connect and unify data from multiple retail platforms
- Retailers are already spending heavily on AI systems that coordinate and automate operations.
- The market is shifting from experimental AI tools to AI systems that run core day-to-day retail operations.

From fragmented
operations to
autonomous
retail
coordination
system.

The shift is already happening

- AI is now core to supply chain execution, not experimentation
- Strong industry push toward AI orchestration and agent-based systems

Future growth

Investment Growth

AI spending in retail accelerating rapidly.

Existing Demand

High willingness to pay for efficiency and inventory optimization.

Potential Leverage

Even 1-2% efficiency improvement is billions in value unlocked

AI tools fail in
retail because they
sit on top of
broken systems – we
build under them.

CEO/CTO - A jack of both
trades

What we need

- Build core AI orchestration and a data integration engine.
- Develop first retail pilots (inventory + forecasting layer)
- Expand the engineering team.
- Secure early enterprise design partners.
